9	Conclusion

1. PROJECT DESCRIPTION

The Assignment Submission Management System is a PHP and MySQL-based web application developed as a centralized platform for managing student assignments. The system is designed for the Jabatan Teknologi Maklumat & Komunikasi and supports two main user roles: Admin and Student. Students can register, log in, view available assignments, submit assignment files, and view their own submissions. Administrators can create assignments, view student submissions, and download submitted files.

The project applies the Full Stack Web Development requirements specified in Mini Project 2, including user authentication and authorization, form processing and validation, multi-page PHP development, AJAX, file handling and upload, database integration, and deployment/version control.

1.1 Project Objectives

- To develop a database-driven assignment submission system using PHP and MySQL.
- To implement secure registration, login, password hashing, sessions, and role-based authorization.
- To provide separate functions and navigation for Student and Admin users.
- To implement assignment searching and dynamic loading using AJAX.
- To allow students to securely upload assignment files and allow administrators to retrieve submitted files.
- To apply prepared statements and validation to reduce invalid input and improve database security.

2. SYSTEM FEATURES

Feature	Description
User Registration	Students can register an account through the registration page. Input data is validated before being stor
User Login	Users log in using valid credentials. Passwords are verified using password_verify().
Password Hashing	Passwords are stored securely using password_hash() rather than plain text.
Role-Based Access	The system separates Admin and Student access and redirects users according to their role.
Session Management	PHP sessions are used to maintain authenticated users and protect restricted pages.
Assignment Management	Admin can create assignments with an assignment title and description.
Assignment Search	Student Dashboard provides live assignment search and dynamic loading using AJAX.
File Upload	Students can upload supported assignment files such as PDF, DOCX and TXT.
Submission Management	Students can view their own submissions while Admin can view all submissions.
File Download	Admin can view and download uploaded student files.
Database Integration	The application uses MySQL database named assignment_system and applies primary/foreign keys an
Reusable Components	header.php, footer.php and db.php are used to reduce repeated code and maintain consistency.
Validation	Client-side JavaScript and server-side PHP validation are applied to forms and file uploads.

3. GITHUB REPOSITORY LINK

The complete project should be uploaded to GitHub together with its commit history. The final repository link should be inserted below before submission.

GitHub Repository: https://github.com/aliyah1126/Mini-Project-2/tree/main/Mini_Project_2_

The repository should contain the complete PHP project, database-related files, README setup instructions, and meaningful commit history from all group members.

4. GIT COMMIT HISTORY

Git is used for version control throughout the development process. Each group member is expected to contribute to the project, and the contribution should be supported by the Git commit history.

INSERT SCREENSHOT OF GITHUB COMMIT HISTORY HERE
The screenshot should clearly show meaningful commits and contributions from all members.

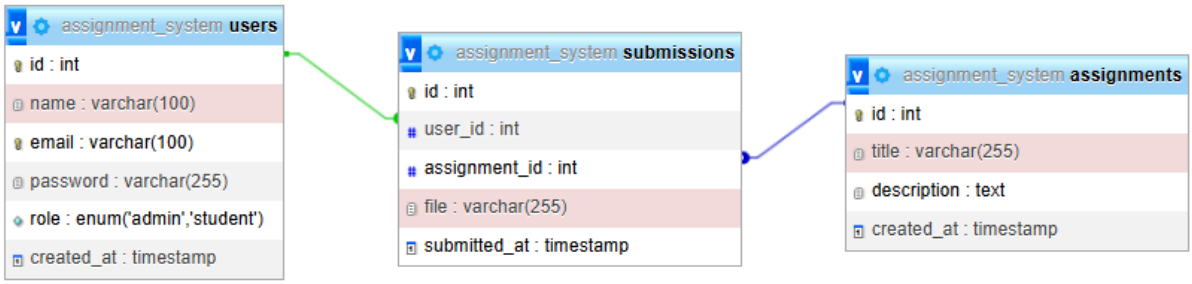

5. DATABASE NAME AND DATABASE STRUCTURE / ERD

Database Name: assignment_system

The database is designed to support users, assignments, and assignment submissions. Based on the project requirements, one user can submit many assignments and one assignment can have many submissions. Primary keys and foreign keys should be defined correctly to maintain the relationships.

5.1 Required Database Relationships

- One user can submit many assignments/submissions.
- One assignment can have many submissions.
- Foreign keys are used to connect related records.
- Prepared statements are used for SELECT, INSERT, UPDATE and DELETE operations.
- SQL JOIN is used in the Admin View Submissions page to display combined information such as student name,assignment title and file.

6. SOURCE CODE

The source code section should contain typed source code rather than screenshots of code. The following project structure is recommended to organize the PHP application and reusable components.

File / Folder	Purpose
db.php	Database connection using MySQLi or PDO.
header.php	Reusable navigation, session handling and common header layout.
footer.php	Reusable footer layout.
register.php	Student registration form and validation.
login.php	User authentication and credential validation.
logout.php	Ends the active session and redirects the user.
student_dashboard.php	Displays assignments and provides AJAX live search/dynamic loading.
submit_assignment.php	Processes assignment submission and secure file upload.
my_submissions.php	Displays the student's own submissions.
admin_dashboard.php	Main dashboard for Admin users.
create_assignment.php	Admin page for creating assignments.
view_submissions.php	Admin page for viewing and downloading student submissions.
ajax/search_assignments.php	Processes AJAX requests for live assignment search.
uploads/	Dedicated folder for uploaded assignment files.
style.css	External stylesheet for consistent interface design.

7. CODE Mini_Project_2

9. TESTING AND VALIDATION

Test Item	Expected Result	Status
Registration	Valid student data is accepted and stored; invalid/empty data is rejected.	To be tested
Login	Valid credentials allow access; invalid credentials are rejected.	To be tested
Role Authorization	Admin and Student are restricted to their respective pages.	To be tested
Session Management	Unauthenticated users are redirected to login.	To be tested
Assignment Creation	Admin can create assignment with valid title and description.	To be tested
AJAX Search	Assignment results update without page refresh.	To be tested
File Upload	Allowed file type/size is accepted; invalid file is rejected.	To be tested
Submission View	Student sees own submissions; Admin sees all submissions.	To be tested
File Download	Admin can download uploaded files.	To be tested
Database Operations	Data is correctly inserted, selected and joined using prepared statements.	To be tested

10. CONCLUSION

The Assignment Submission Management System provides a structured platform for managing student assignments using PHP, MySQL, Bootstrap and related web technologies. The system is designed around two roles, Admin and Student, with authentication, authorization, validation, AJAX functionality, file handling, database integration and version control forming the main components.

By implementing these features, the system can provide a more organized method for students to submit assignments and for administrators to manage assignment records and submissions. Before final submission, the project should be tested on Laragon, the database export should be prepared, the complete project should be pushed to GitHub, and the actual screenshots, repository link and typed source code should be inserted into this report.

REPORT COMPLETION CHECKLIST

- ■ Complete project folder (.zip) prepared.
- ■ Database export file (.sql) prepared.
- ■ GitHub repository link inserted.
- ■ Git commit history screenshot inserted.
- ■ Database/ERD screenshot inserted.
- ■ Typed source code inserted.
- ■ Output screenshots inserted with explanations.
- ■ README contains database name and setup instructions.
- ■ Final project tested successfully on Laragon.

1. RUBRIC MINI PROJECT 2

CRITERIA	4 Excellent	3 Good	2 Satisfactory	1 Weak	Weightage	Score
User Authentication & Authorization -Registration & Login -Password hashing -Role-based access -Session management	Fully functional authentication system with secure password hashing, proper rolebased access, and session management	Authentication system mostly functional with minor issues in role or session handling	Basic login and registration working but lacks proper security or role implementation	Authentication implemented but contains major errors or is incomplete	*15 = 4	
Form Processing & Validation	All forms handled correctly using POST with complete clientside and server-side validation	Most validation implemented correctly with minor issues	Basic validation present but incomplete or inconsistent	Validation implemented but contains major errors or missing key components	*12 = 4	
Multi-Page Application Development -Admin & Student pages -Navigation -Reusable components - UI consistency	Complete multi-page system with proper navigation, reusable components, and consistent UI	Most pages are functional with minor navigation or UI issues	Basic pages exist but lack consistency or structure	Multi-page structure implemented but incomplete or not functioning properly	*12 = 4	
AJAX Development -AJAX implementation -Live search -Dynamic loading	AJAX fully implemented with dynamic data loading and no page refresh	AJAX works with minor issues in functionality	Basic AJAX implemented but limited features	AJAX implemented but contains errors or not functioning properly	*15 = 4	

File Handling & Upload	File upload, validation, storage, and retrieval fully functional and secure	File upload works with minor issues	Basic file upload implemented but lacks validation or retrieval	File upload implemented but contains major errors	*15 = 4	
CRITERIA	**4 Excellent**	**3 Good**	**2 Satisfactory**	**1 Weak**	**Weightage**	**Score**
Deployment & Version Control	Proper Git usage with consistent commits, meaningful messages, and contributions from all members	Git used with minor issues (limited commits or uneven contribution)	Minimal Git usage with few commits	Git implemented but lacks proper usage or evidence	__*15 = 4	
Originalityof Submission	Clearlyoriginal structure and logic	Mostly original work	Standard implementation	Similar to peers / AI	__*8 = 4	
Timelinessof Submission	Submitted on time	< 1 day late	1-2 days late	More than 2 days late	__*8 = 4	
				TOTAL	**/100**	

* Zero (0) mark will be given if students do not answer or perform the criteria needed.
